

SAFETY360DOC

SafePredict

Construction Safety
Intelligence Platform

User Guide

Predict it. Prevent it.

Version 1.0 June 2026

Predict safety risk before it becomes
an incident. One platform for your team,
your jobsites, and your peace of mind.

AI Risk Forecasting

Know what's coming before it arrives

Field Workflows

JSAs, Permits, Incidents, all in one place

Training Compliance

Never miss a certification again

Safety Intelligence

Turn data into decisions

Table of Contents

1	Welcome to SafePredict	What the platform does and who it's for
2	Getting Started	Signing in, navigation, and your first steps
3	The Dashboard	Your daily safety overview at a glance
4	Predictive Risk	Understanding your AI risk forecast
5	Field Workflows	JSAs, Permits, Incidents, Field Issues
6	Training & Compliance	Track certifications and renewals easily
7	User Roles	What each person can see and do
8	How SafePredict Thinks	How AI turns your data into risk intelligence
9	Investigating Incidents	Root cause analysis made simple
10	Tips for Getting the Most Out of It	Best practices from day one

1 Welcome to SafePredict

SafePredict is a construction safety intelligence platform designed to help your company **predict safety problems before they happen** — not just document them after the fact. It combines everything your safety operation needs into a single workspace: field workflows, compliance tracking, document control, and an AI that reads your safety data and tells you where risk is building.

Most safety platforms look backward. SafePredict looks forward.

Built for Every Level of Your Team

Company Leaders

Get a clear answer to the question that matters most: is safety work current, and where is exposure rising? No more digging through binders or chasing updates from the field. SafePredict gives you a live picture of your company's risk posture across every jobsite, every week.

- Real-time risk band across all jobsites
- Open work summary — what's overdue, what needs owner attention
- AI-generated recommendations based on your actual safety data
- Compliance reports for insurance, audits, and regulatory review

Safety Managers

Run a disciplined daily and weekly safety rhythm. Know what is open, what is overdue, and which risk signals are building — without spending hours pulling reports or chasing paper.

- Daily open-work view with one-click navigation to urgent items
- AI safety advisor that surfaces what to focus on this week
- Training matrix showing every certification status across the workforce
- Incident investigation workflow with root cause tracking

Field Teams

Give your foremen and crew the tools to stay on top of safety at the jobsite level — without paperwork and without friction. Everything they need is in one place, accessible from any device.

- JSA Builder for task-specific hazard analysis before work starts
- Permit Center for hot work, confined space, excavation, and more
- Field issue log — report unsafe conditions in under two minutes

- Incident reporting with immediate corrective action assignment

2 Getting Started

Getting into SafePredict is simple. You do not need to install anything — the platform runs entirely in your web browser. Your company administrator will invite you by email and your account will be ready in minutes.

Your First Sign-In

- 1 Open the invitation email from SafePredict and click **Accept Invitation**.
- 2 Set your password on the sign-up page.
- 3 Sign in at your company's SafePredict address.
- 4 You will land on the **Dashboard** — your safety command centre.

Finding Your Way Around

The left sidebar is your main navigation. You will only see sections your role has access to. Here is a quick map:

Dashboard	Your live safety overview — risk band, open work, and quick actions.
Insights	Command Center, safety analytics, and your risk trend history.
Jobsites	Your jobsite list, emergency action plans, and site details.
Field	JSA Builder, Permit Center, Field Issues, and Observations.
Incidents	Report and investigate incidents. Track corrective actions.
Training	Your team's certification matrix and renewal schedule.
Documents	Safety document library — upload, search, and review.
Team	User management, role assignments, and jobsite access.
Settings	Company profile, billing, integrations, and preferences.

NOTE: If a menu item is missing, your role may not include access to it. Ask your company administrator to adjust your permissions.

3 The Dashboard

The Dashboard is the first thing you see when you sign in. It is designed to answer one question in under ten seconds: *what needs my attention right now?* Everything on the dashboard is live — it updates as your team logs activity in the field.

Main Dashboard

Figure 1 — The SafePredict Dashboard. Risk band (top), open work tiles, and recent activity.

What You'll See

Risk Band	A colour-coded indicator — Low, Moderate, High, or Critical — showing your current safety risk level. Updated continuously as your team logs data.
Open Work Tiles	Quick counts of open issues, overdue corrective actions, active permits, open incidents, draft reports, and JSAs in progress. Click any tile to jump straight to that list.
Recent Activity	A live feed of the latest safety events, document reviews, and field reports from your team.

Recommendations	Suggestions from the AI — specific things your team should focus on this week, based on what the data is showing.
Quick Actions	One-click shortcuts to log an incident, create a JSA, submit a field observation, or add a document.

Command Center

Figure 2 — Command Center (Insights > Command Center). A deeper weekly safety review with AI recommendations.

The **Command Center** (found under Insights in the sidebar) gives you a deeper weekly view of your safety posture. It shows your full risk score, all open work in one scrollable view, AI-generated recommendations, and the company memory bank — where your team can store rules, lessons, and procedures for the AI to reference when making suggestions.

4 Predictive Risk

The AI risk forecast is SafePredict's most powerful capability. Instead of just showing you what has happened, it reads the signals in your safety data and tells you where risk is heading — giving you time to act before an incident occurs.

Your Risk Forecast

Figure 3 — Predictive Risk view. Shows your current risk forecast, key signals, and recommended actions.

The Four Risk Bands

Your risk band is always one of four levels. Think of it like a safety weather forecast — it tells you what the data is showing right now and what is likely to build if you do not act.

LOW	Routine controls are working. No elevated signals. Keep doing what you're doing.
MODERATE	Some signals are building. Review open corrective actions and watch the listed risk drivers.
HIGH	Multiple signals are converging. Escalate to the safety manager today. Hold a crew briefing.
CRITICAL	Immediate review required. Consider a stop-work evaluation for high-risk activities.

What Drives Your Risk Forecast

The AI reads dozens of signals from your safety data at once — the same way a skilled safety professional would, but automatically and continuously. Here are the key categories it looks at:

Your incident history	How many incidents have happened in your company, when, and for which trades — including whether the numbers are trending up or down.
Open corrective actions	Unresolved issues and overdue follow-ups are one of the strongest signals the forecast reads. The longer they stay open, the more weight they carry.
Training and certifications	Expired or expiring certifications for trades currently active on your jobsite raise your risk level directly.
Permits and JSAs	Permits that are missing, expired, or have incomplete sign-offs signal that planned controls are not in place.
Field observations	Near-misses and unsafe condition reports — especially repeated ones — are leading indicators that the AI weighs heavily.
Weather conditions	Temperature extremes, wind, ice, and storm conditions are automatically factored in based on your jobsite location.
Crew exposure	Long shifts, overtime, new workers on site, and multi-trade interference all contribute to your risk level.

Figure 4 — Risk signal detail view. Shows which specific signals are driving your current forecast.

5 Field Workflows

SafePredict gives your field teams practical, fast-to-complete workflows that keep safety visible at the jobsite level. Every entry your crew makes also feeds the AI forecast — so the work you do in the field makes the whole platform smarter.

JSA Builder | Job Safety Analysis

Create task-specific JSAs before high-risk work begins. Identify hazards, assign controls, and get sign-off from crew members. Templates speed up repeat tasks.

- 1 Go to Field > JSA Builder and click New JSA.
- 2 Choose the job type and add tasks, hazards, and controls.
- 3 Assign the JSA to crew members for sign-off.
- 4 Submit — the JSA feeds into your risk forecast automatically.

Permit Center | Work Permits

Manage hot work, confined space, excavation, and other high-risk permits in one place. The permit center tracks status, expiry, and stop-work orders.

- 1 Go to Field > Permit Center and click New Permit.
- 2 Choose the permit type and complete all required fields.
- 3 Submit for approval by the designated manager.
- 4 The permit shows as Active on the dashboard once approved.

Incident Log | Incident Reporting

Report injuries, near-misses, and property damage. The incident log tracks every step from first report through investigation and corrective action closure.

- 1 Go to Incidents > Log Incident and fill in the details.
- 2 Classify the incident type and severity.
- 3 Assign an investigator and set a due date.

- 4 Track corrective actions until they are verified closed.

Field Issues | Corrective Actions

Log unsafe conditions, near-misses, and required follow-ups. Field issues become corrective actions with owners and due dates — and they count toward your open-work score.

- 1 Go to Field > Field Issues and click New Issue.
- 2 Describe the problem, set priority, assign an owner, and set a due date.
- 3 The owner receives a notification and acts on it.
- 4 Mark resolved — the issue drops from your open work count.

6 Training & Compliance

Keeping your workforce certified is one of the fastest ways to lower your risk score. SafePredict tracks every certification, renewal date, and training completion across your entire workforce — so you never get caught out by an expired certificate again.

Training Matrix

Figure 5 — Training Matrix. Green = current, amber = expiring soon, red = expired.

- 1 Go to **Training** in the sidebar.
- 2 Each row is a team member; columns show their required certifications.
- 3 **Green** = current · **Amber** = expiring within 30 days · **Red** = expired
- 4 Click any cell to view details or log a new training completion.
- 5 Use **Filters** to view by jobsite, trade, or certification type.
- 6 Export the matrix to a spreadsheet for offline reporting or subcontractor checks.

Training and Permits Together

Figure 6 — Combined Training and Permit view. Confirm both crew certs and permit status before work starts.

The combined **Training and Permits** view is ideal for foremen who need to confirm at a glance that their crew is certified and their permits are active before starting a task. One screen, two checks, zero surprises.

7 User Roles

Every person on SafePredict is assigned a role that controls what they can see and do. This keeps the right information in the right hands — field teams see their jobsite, managers see everything, and nothing leaks between companies or projects.

Company Admin

Full access to all company settings, billing, team management, and every module.

- Invite and manage all users and assign roles
- Set up jobsites, company profile, and training requirements
- View all reports, analytics, and AI recommendations
- Manage billing and integrations

Safety Manager

Full access to safety workflows, risk analytics, and document control. Can manage teams and jobsite assignments.

- All field workflows and document review
- Training matrix management and certification tracking
- Command Center, risk trends, and AI recommendations
- Incident investigation and corrective action oversight

Foreman / Jobsite Lead

Jobsite-scoped access. Manages their assigned crew and runs field workflows for their site only.

- Create JSAs and permits for their assigned jobsite
- Log field issues and incidents; assign corrective actions
- View their crew's training and certification status
- Cannot access other jobsites or company-wide settings

Field Worker

Basic field access. Can complete assigned workflows and submit observations.

- Complete assigned JSAs and permits
- Submit field observations and near-miss reports
- View their own training status
- Cannot create records independently or manage other users

Read-Only

View-only access. Can see reports and dashboards but cannot create or change anything.

- View all reports and dashboards
- Export data for offline use
- No create, edit, or delete access

NOTE: A Company Admin can adjust role permissions to match your specific workflows. If you cannot see a section you need, ask your admin to update your access.

8 How SafePredict Thinks

You do not need to understand the technology to benefit from it — but knowing how SafePredict uses your data helps you get more out of the platform. This section explains the AI in plain language.

SafePredict reads your safety data the way an experienced safety professional would — only faster, and it never takes a day off.

It Reads Signals, Not Just Records

Most safety software stores records. SafePredict reads them for signals. When your foreman logs a corrective action, the platform does not just save the entry — it asks: is this hazard type appearing more often? Is it overdue? Has it shown up before an incident in your history? The AI combines hundreds of these questions simultaneously and surfaces the answer on your dashboard as a risk band and a set of specific, prioritised recommendations.

It Knows Your Company, Not Just the Industry

SafePredict does not rely on generic industry benchmarks. It learns from your incident history, your trades, your crew profiles, and your jobsite conditions. The longer you use the platform and the more data your team enters, the more accurate your risk forecast becomes — because it is calibrated to your reality, not a national average.

Your history shapes your baseline

Past incidents, seasonal patterns, and trade-specific risks in your company's own data form the foundation of every forecast. Two companies in the same trade may have different risk forecasts because their histories are different.

Leading indicators predict what is coming

The most powerful signals are the ones that come before an incident — near-misses, overdue corrective actions, repeated unsafe conditions, and training gaps. SafePredict monitors all of these continuously and alerts you before they compound.

Your controls matter

The AI also reads what your team is doing right — permit compliance, timely corrective action closures, full training coverage. Strong controls actively lower your risk score. You are rewarded for good safety work, not just penalised for gaps.

More data means better forecasts

The platform gets more accurate the more you use it. Every near-miss logged, every certification updated, every corrective action closed on time improves the accuracy of your next forecast. Think of it as a compound interest account for safety intelligence.

The AI explains itself

SafePredict never gives you a risk band without telling you why. Every forecast includes the specific signals that drove it, so your team always knows where to focus — not just that there is a problem, but exactly what it is and what to do.

Risk and Confidence — Two Different Things

SafePredict always shows you two things: how high your risk is, and how confident it is in that assessment. **High risk with lower confidence** means: the data is pointing to a problem, but your team has not logged enough recently for the platform to be certain. The right response is to log more — not to assume you are safe. **High risk with high confidence** means the data is strong and clear: act now.

RISK BAND + CONFIDENCE	WHAT IT MEANS	WHAT TO DO
Low risk, any confidence	Routine controls are working. No elevated signals detected.	Maintain your rhythm. Continue logging so the forecast stays accurate.
Moderate risk	Signals are building. One or more risk drivers are active.	Review the listed drivers. Assign owners to any overdue corrective actions.
High risk, lower confidence	Multiple signals detected but data coverage has gaps.	Treat as High risk. Log missing observations and close data gaps.
High risk, high confidence	Clear, well-supported elevated risk. Do not wait.	Escalate to safety manager. Crew briefing today. Act on recommendations.
Critical risk	Severe signals detected. Immediate review required.	Leadership review now. Evaluate stop-work for high-risk activities.

9 Investigating Incidents

When an incident happens, what you do in the next 48 hours determines whether it happens again. SafePredict's incident investigation workflow guides your team from first report to closed corrective actions — and stores the findings so the AI can help prevent the same type of incident from building in the future.

The Six-Step Process

- | | | |
|---|-----------------------------|---|
| 1 | Incident Occurs | An injury, near-miss, property damage, or stop-work condition happens on site. |
| 2 | Immediate Report | The field worker or foreman submits an incident report the same day — before end of shift. The sooner it is reported, the more accurate the record. |
| 3 | Investigation Opened | The foreman or safety manager opens a formal investigation, assigns an investigator, and sets a due date. The investigation appears in the open-work dashboard until it is closed. |
| 4 | Root Cause Analysis | The investigator identifies what directly caused the incident AND why the conditions existed in the first place. SafePredict stores both the immediate cause and the root cause — because root causes are what recur. |
| 5 | Corrective Actions | One or more corrective actions are generated from the findings. Each action has an owner and a due date. Critical actions are flagged — the risk score will not fully improve until they are verified closed. |
| 6 | Investigation Closed | Once all corrective actions are verified complete, the investigation closes. The findings are stored in your safety history and used to improve future risk forecasts. |

Why Root Cause Matters More Than Immediate Cause

The immediate cause is what physically happened — a worker slipped, a load dropped, a permit was missing. The root cause is why the conditions existed in the first place — no housekeeping plan, no permit requirement enforced, supervision not present. SafePredict stores both, but the root cause is what drives the AI's understanding of your company's specific risk patterns. Identify it accurately and the platform gets better at preventing it.

The Causes SafePredict Tracks

When completing an investigation, you will classify the root cause into one of these categories. Each category connects to a different type of prevention — which is why the classification matters:

Unsafe Act or Behaviour	Workers bypassed a control, worked distracted, or skipped PPE. Prevention: behaviour-based observations, coaching, and recognition.
Unsafe Condition	Defective equipment, poor housekeeping, unstable surface, or missing guarding. Prevention: pre-task inspections and hazard identification.
Inadequate Planning	No JSA, poor permit quality, or insufficient hazard identification before work started. Prevention: stronger pre-task planning discipline.
Training or Competency Gap	Required training was not completed or certification had expired. Prevention: training matrix monitoring and timely renewals.
Supervision Gap	Supervisor was absent, the pre-task check did not happen, or stop-work authority was not used. Prevention: supervisor accountability systems.
Equipment or Tool Issue	Equipment was not inspected, wrong tool used, or equipment was overloaded. Prevention: equipment inspection programmes.
Environmental Factor	Adverse weather, congested site, or third-party interface hazard. Prevention: weather monitoring and site coordination protocols.
Management System Gap	No written procedure, poor communication of requirements, or lessons from past incidents not shared. Prevention: programme review and lessons-learned culture.

MOST COMMON MISTAKE: The most common mistake is stopping at the immediate cause. 'Worker slipped' explains the event. 'No slip-resistant surface requirement in the daily pre-task checklist' explains why it keeps happening. Always ask: what allowed this condition to exist?

10 Tips for Getting the Most Out of It

SafePredict works best when your whole team uses it consistently. Here are the habits that make the biggest difference:

Log near-misses the same day they happen	Near-misses are the most powerful risk signal in the platform. Every one you log teaches the AI what is building on your site — and gives your team the chance to fix it before someone gets hurt. A five-minute report can prevent a serious incident.
Close corrective actions before their due date	Open, overdue corrective actions are one of the fastest ways to push your risk band up. Make closing them a daily habit — not a weekly catch-up. When you close an action on time, your risk score improves directly.
Keep the training matrix current	Log training completions the same day they happen. Expired certifications for active trades raise your risk band automatically. An up-to-date matrix is one of the lowest-effort, highest-impact things you can do for your AI forecast.
Use the Command Center every Monday morning	Safety managers should start every week in the Command Center. Check whether the risk band has moved, review overdue actions, read the AI recommendations, and assign owners to anything urgent. Ten minutes on Monday can prevent a bad week.
Complete jobsite profiles fully	The AI uses your jobsite location, active trades, and crew information to tailor the risk forecast. Incomplete profiles produce less accurate forecasts. Fill in every field when you set up a new jobsite.
Ask Gus anything	The Gus AI assistant is available throughout the platform. Click the Gus icon to ask questions in plain language — about regulations, how to fill out a form, what a risk signal means, or what you should focus on today. Gus reads your company's memory bank and safety data when answering, so answers are specific to your situation.
Use Reports for your insurance and audit conversations	The Reports module can generate compliance summaries, incident histories, and training status reports in PDF format. Having these ready before an audit or renewal conversation puts you in control of the narrative.
Treat the risk band as a weather forecast	You would not ignore a severe weather warning just because the sun is out right now. Treat a HIGH or CRITICAL risk band the same way — act on it before the conditions deliver the outcome the data is signalling.

Need Help?

The **Gus** AI assistant is available anywhere in the platform — just click the Gus icon and ask your question. For account or billing support, contact your company administrator. For technical support, reach the SafePredict team at support@safepredict.com.
